ABSTRACT

Educational institutions maintain large collections of examination questions, making it difficult for faculty to retrieve suitable questions efficiently. The Question Bank Management System is designed to simplify the storage, organization, and retrieval of questions using Data Structures and Algorithms (DSA). The system categorizes questions based on subject, topic, difficulty level, marks, and keywords, enabling quick and accurate searches. Efficient data structures such as Hash Maps, Trees, and Arrays are used to optimize storage and retrieval, while sorting algorithms help organize questions according to different criteria. The system also supports adding, updating, deleting, and filtering questions, reducing manual effort and improving productivity. By applying DSA concepts to a real-world educational problem, the project enhances search efficiency, scalability, and maintainability. This solution provides a user-friendly platform for managing question banks and assists educators in preparing balanced and relevant examination papers efficiently.
